

CRTE Power Capacitors

In its power factor correction systems, ICAR uses only capacitors entirely made within the facilities of its group. This way, ICAR guarantees the highest quality of the finished product.

The film used in the CRTE power capacitors comes directly from the ICAR experience in the high performance capacitors, in particular it is defined as "High density metallized polypropylene film".

High density metallized polypropylene film capacitors

The main difference in comparison to standard polypropylene capacitors is the way in which the dielectric film is metallized.

In standard polypropylene capacitors the thickness of the metal layer deposited on the film surface is constant; in 1995, instead, ICAR has developed a manufacturing process that enables obtaining a metal layer with properly modulated thickness and achieving extraordinary results in the capacitors field for direct current and energy accumulation applications.

Subsequently this technology has been extended to capacitors for alternating current applications, with same remarkable results in power factor correction of industrial facilities.

The modulation of the metallization thickness, considerably betters capacitors performances (and therefore those of the power factor corrector systems of which they are the basic component) in terms of:

- increased specific power (kvar/dm³) with resulting reduction of power factor corrector systems dimension;
- improvement of the strengthens to continuous and temporaries overvoltage for a better reliability even in plants with voltage peaks due to the network or manoeuvres on the plant; CRTE capacitors are in fact tested at three times the rated voltage (type test);
- better reaction to the internal short circuit thanks to the special metallization with variable thickness.

General description

CRTE is the ICAR last generation of metallized polypropylene film capacitors to be used for power factor correction and harmonic filtering in low voltage plants.

The main features are:

- Three phase windings delta connected in a cylindrical aluminum case;
- Rated power from 2,5kvar up to 50kvar;
- Rated voltage from 230V up to 800V;
- Rated frequency 50 / 60 Hz;
- IP20 terminal board;
- Reduced mounting cost thanks terminal lid connections;
- Up to 130.000 hours service life design;
- Dry, environment friendly construction;
- Suitable for any mounting position (vertical preferable for better cooling);
- Indoor installation;
- Made under Quality System in accordance with ISO 9001 standard.

Applications

- Individual fixed Power Factor Correction for motors, low voltage transformers, etc;
- Low voltage automatic Power Factor Correction Capacitor Banks;
- Low voltage detuned/tuned Capacitor Banks.

Damping of Inrush Current

Capacitors used for power factor correction have to withstand a lot of switching operations.

The switching of a capacitor in parallel with energized capacitor banks, produces extremely high inrush currents and voltage transients.

The connection of a low voltage power factor correction capacitor without damping to an AC power supply, could lead to a reduced lifetime.

For this reason, capacitors should be protected during the switching operation by means of suitable contactors equipped with damping resistors (AC6b).

Harmonics

Harmonics are sinusoidal voltages and currents with multiple frequencies of the 50 or 60 Hz line frequency.

In presence of harmonics the resonance phenomena can be avoided by connecting capacitors in series with reactors (detuned filters). Components for detuned filter must be carefully selected (see next chapter). Particular care has to be taken for capacitors because the voltage across them will be higher than the nominal voltage when they have a reactor in series.

Discharging

Capacitors must be discharged in 3 minutes to 75V or less. There shall be no switch, fuse or any other isolating device between the capacitor unit and the discharging device. ICAR supplies capacitor discharge resistors to all series.

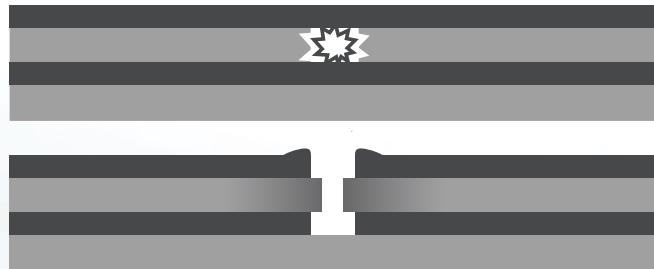

Safety features

CRTE capacitors are equipped with the most modern and reliable safety features to keep capacitor working in proper conditions and to prevent heavy breakdowns.

Self-healing metallized polypropylene

This metallized polypropylene feature is widely used in Power Capacitors as a mean to keep capacitors working even when voltage breakdown between the metal layers occurs. In case of arc, the metallized surface around is evaporated but the breakdown is kept in limited area and it does not enlarge its effects.

Over pressure safety device

In the case or fault, due to over voltage, overload or normal ageing, the self-healing process may accelerate and so to create a increasing pressure within the case. In order to prevent the case from bursting, capacitor is fitted with an over pressure device that set out of service the capacitor from the supply; two of the supply leads have reduced section, and while the pressure increases leads are strained by the top lid till breaking of cables (see figure below).

Dry technology

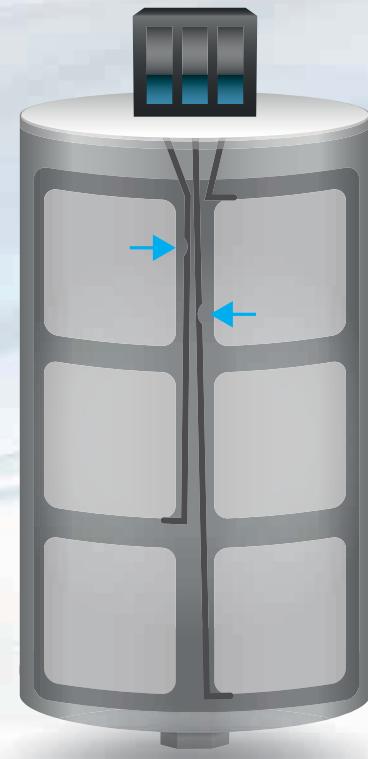

As CRTE capacitor is filled with resin, there is no risk of leaking oil or gas.

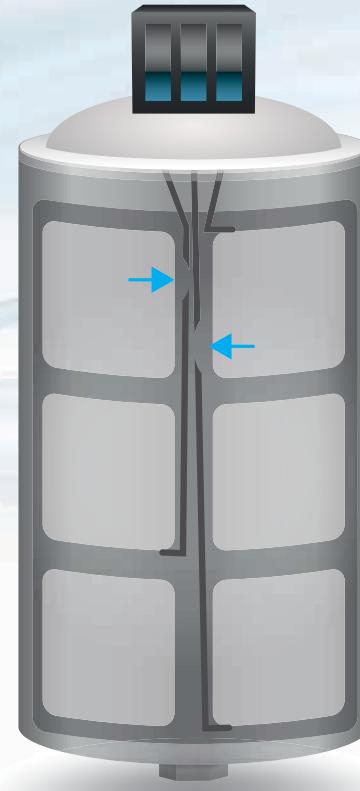

Touch proof terminals

CRTE is equipped with terminal board of IP20 protection degree (see product tables for specific feature application).

Overpressure safety device

CAPACITOR IN WORKING CONDITIONS

CAPACITOR WITH OPERATED MECHANISM

Inside layout

Metallized Polypropylene

ICAR has its own manufacturing of base polypropylene and relevant metallization: further it has developed a peculiar process that enables obtaining a metal layer with properly modulated thickness and achieving extraordinary performances in terms of voltage withstand and overall reliability.

The film is then cut and wound on high precision and fully automated winding machines, sprayed with abundant metal contact layer to reduce the contact resistance.

Wave cut film

CRTE capacitors are also fitted with wave cut film to reduce the stress between the polypropylene film layers and the contact layer. This enable capacitors to withstand higher inrush currents during the switching operations.

Environmentally friendly filler

Capacitors need filler around capacitive elements in order to protect metal layers from oxidation and to help heat dissipation.

Without this feature capacitors would cope with accelerated self healing and so a shorter service life.

ICAR filler are all PCB free.

Inside wiring

Power factor correction Capacitors for applications in nominal voltages networks of 600/660/690V (eg. Applications such as mining, highway tunnels and rail cargoes on board ship, port cranes, steel mills, paper mills and other "heavy" applications) can be realized in different ways described as follows.

Capacitors with star connection

A widely used mode embodiment, but risky, provides a capacitors star connection (fig 1): in this way capacitors are subjected to a voltage equal to the nominal plant divided by $\sqrt{3}$.

- Advantages: capacitors are smaller and cheaper, getting more compact and lightweight banks.
- Disadvantages: in case capacitor capacity degradations, the voltage across the capacitors of the star will no longer be balanced, but it will increase on the side with greater capacity degradation, till to reach values higher than the rated voltage of the capacitors themselves. In this situation, the risk of overvoltage with possible consequent capacitors explosion/fire increases dramatically.

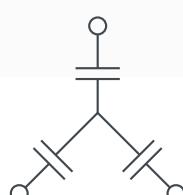

Fig 1: Capacitors star connection

Delta-connected Capacitors

This solution calls for the use of capacitor elements with a voltage rating at least equal to that of the network, as can be seen in Figure 2.

- Advantages: capacitor is electrically robust. Even in case of loss of capacity of a capacitor element, the others do not suffer any consequences: malfunctions risks and capacitors damages are reset.
- Disadvantages: capacitors bulkier and heavier, with higher costs.

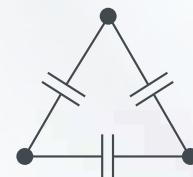

Fig 2: Capacitors delta connection

The ICAR way

CRTE for working voltages higher than 550V are made with delta connected capacitors, and so they have a nominal voltage equal or higher than the system network working voltage; this is the most sound and reliable solution.

Installation and maintenance

Handling and Storage

Capacitors shall have to be handled and stored with care in order to avoid any mechanical damage during transportation. Protection against environmental influences shall also be taken.

Installation

Capacitors are suitable for indoor installation and for any mounting position ($Q \leq 30 \text{ kVAr}$). Vertical is preferable for better cooling if $Q > 30 \text{ kVAr}$.

Capacitors must be installed in such a way that the specified limit temperature is not overcome.

Not being in compliance with the above instructions will result as a reduction of the expected service life.

Installation of capacitors shall have to be performed in such a way that any dangerous resonance phenomena due to harmonics is avoided.

Automatic power factor correction banks

The switching of a capacitor bank in parallel with energized capacitor(s), produces extremely high inrush currents and voltage transients. For this reason, it is extremely important to wait for the unit discharge before a new switching.

Assembly

Capacitors shall have to be assembled by means of the threaded M12 bottom stud. The maximum applicable tightening torque is 10Nm.

The catalogue specifies the recommended cross section of the supplying cables.

The recommended tightening torque is 3Nm.

With terminals screw design two antagonist spanners shall be used.

In order to ensure a proper operation of the internal overpressure safety device, an extra minimum 15mm

clearance distance between the upper part of capacitors and assembly enclosures shall have to be provided. Capacitors shall be placed in such a way that there is an adequate dissipation by convection and radiation of the heat produced by the capacitor losses.

The ventilation of the operating room and the arrangement of the capacitor units shall provide good air circulation around each unit. A minimum 20mm distance between the units has to be maintained.

Maintenance

Periodical checks and inspections are required to ensure reliable operation of capacitors. Monitoring and recording of the electrical service parameters are also recommended to become acquainted with progressive capacitors stress conditions.

Protections

Capacitors shall have to be protected against inrush peak currents during switching operations of automatic banks by means of suitable contactors equipped with pre-making resistors.

Safety Instructions

DO NOT MISAPPLY CAPACITORS FOR POWER FACTOR CORRECTION APPLICATIONS

Capacitors according to the Standards, are equipped with a suitable discharge device such as discharge resistors, permanently connected. They are able to reduce the residual voltage so that any dangerous resonance phenomena due to harmonics is avoided.

Automatic power factor correction banks

DO NOT TOUCH ANY CAPACITOR TERMINAL IF NOT SHORT CIRCUITED AND EAR THED IN ADVANCE To prevent damage to people and goods due to improper usage and/or application of capacitors, the "RECOMMENDATION FOR THE SAFE USE OF STATIC CAPACITORS, BANKS AND EQUIPMENT FOR POWERFACTOR CORRECTION" published by ANIE shall have to be strictly respected.

ICAR is not responsible for any kind of possible damages occurred to people or things, derived from the improper installation and application of Power Factor Correction capacitors.

Most common misapplication forms

- Current, voltage, harmonics and frequency above specification;
- Working or storage temperature beyond the specified limits;
- Unusual service conditions as mechanical shock and vibrations, corrosive or abrasive conductive parts in cooling air, oil or water vapour or corrosive substances, explosive gas or dust, radioactivity, excessive and fast variations of ambient conditions, service areas higher than 2000 m above sea level...

In case of doubt in choice or in performances of the capacitors ICAR technical service MUST be contacted.

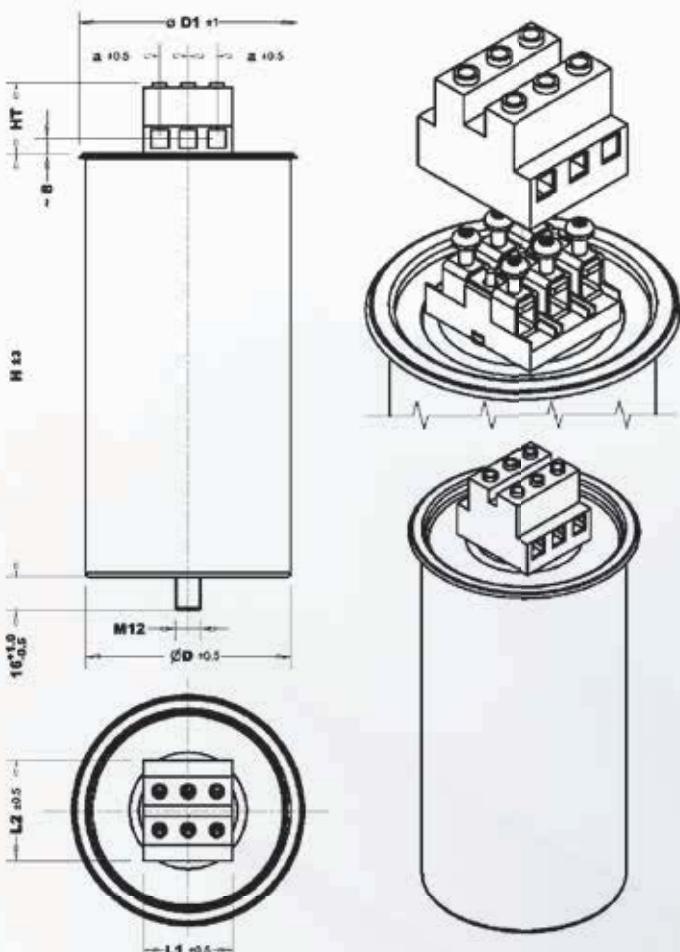

Personal Safety

Electrical or mechanical misapplications of CRTE capacitors may become hazardous. Personal injury or property damage may result from disruption of the capacitor and consequent expulsion of melted material. Before using the capacitors in any application, please read carefully the technical information contained in this catalogue.

The energy stored in a capacitor may become lethal. The capacitor should be short circuited and earthed before handling to prevent any chance of shock. Special attention must be taken to make sure the capacitors are correctly used for each application and that warnings and instructions are strictly followed. Capacitors are made with polypropylene that is a flammable material.

The risk of fire cannot be totally eliminated; therefore suitable precautions shall be taken. Reliability data have a statistical value (i.e. based on a large number of components), it is not possible to transfer automatically data from a limited quantity or even to a batch of capacitors. This applies in particular to consequential damage caused by component failure.

Dimensions and connecting cable cross section

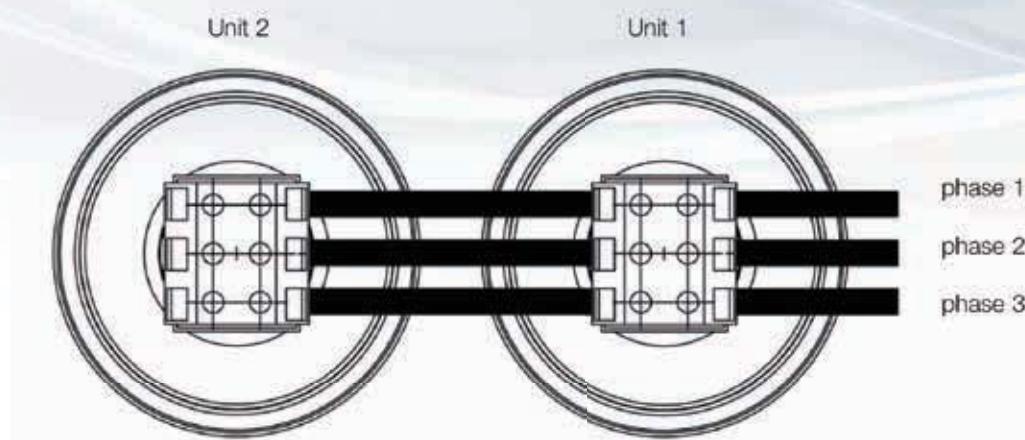

- Aluminium finishing: black painted for diameter ØD 100, ØD 116, ØD 136. naked for diameter ØD 75, ØD 85

Limits for parallel of crte capacitors

The maximum number of parallel connected units should not have a total output higher than 40kvar.

The cross section of cables in the Unit 1 (phase 1, 2, 3) have to be selected considering the total amount of the Unit 1 and Unit 2 output. **Leave enough space** to allow longitudinal expansion of the can for proper operation of the internal over pressure safety device (15 mm).

A minimum space of 20 mm between capacitors is necessary to ensure **proper cooling**.

525V - 50Hz

TECHNICAL CHARACTERISTICS

Dielectric	polypropylene metallized film
Winding connection	delta
Safety device	Internal overpressure disconnector
Capacitance tolerance	-5%, +10%
Rated Voltage	525V
Rated Frequency	50 Hz
Over voltages	According to IEC Un + 10% (up to 8 hours daily) Un + 15% (up to 30 minutes daily) Un + 20% (up to 5 minutes daily) Un + 30% (up to 1 minute daily)
Over current (not continuative)	2 In (including harmonics)
Maximum inrush current	200 In
Insulation level	3 / 15 kV
Voltage test between terminals	2,15 Un, 50Hz, 10 seconds (routine test)
Voltage test between terminals	3,00 Un, 50Hz, 60 seconds (type test)
Voltage test terminals/case	3000V, 50Hz, 10 seconds
Dielectric losses	< 0,2 W/kvar
Temperature class	-25/D
Cooling	Natural air or forced ventilation
Permissible humidity	95%
Service life	130.000 operating hours (hot spot 50°C)
Service life	100.000 operating hours (hot spot 55°C)
Altitude above sea level	2000 m
Impregnation	resin filled, PCB free
Terminals	Terminal board / screws (D ≤ 65mm)
Fixing and Ground	Threaded M12 stud on case bottom
Mounting position	vertical preferable for better cooling
Protection degree	IP20 (only D ≥ 85mm)
Installation	Indoor
Discharge resistors	Included
Discharge time	< 3 minutes to 75V or less
Applicable standards	IEC 60831-1/2

Vn = 525V - 50Hz

CRT-E 480V - 60Hz

TECHNICAL CHARACTERISTICS

Dielectric	polypropylene metallized film
Winding connection	delta
Safety device	Internal overpressure disconnector
Capacitance tolerance	-5%, +10%
Rated Voltage	480V
Rated Frequency	60 Hz
Over voltages	According to IEC Un + 10% (up to 8 hours daily) Un + 15% (up to 30 minutes daily) Un + 20% (up to 5 minutes daily) Un + 30% (up to 1 minute daily)
Over current (not continuative)	2 In (including harmonics)
Maximum inrush current	200 In
Insulation level	3 / 15 kV
Voltage test between terminals	2,15 Un, 50Hz, 10 seconds (routine test)
Voltage test between terminals	3,00 Un, 50Hz, 60 seconds (type test)
Voltage test terminals/case	3000V, 50Hz, 10 seconds
Dielectric losses	< 0.2 W/kvar
Temperature class	-25/D
Cooling	Natural air or forced ventilation
Permissible humidity	95%
Service life	130.000 operating hours (hot spot 50°C)
Service life	100.000 operating hours (hot spot 55°C)
Altitude above sea level	2000 m
Impregnation	resin filled, PCB free
Terminals	Terminal board /screws (D ≤ 65mm)
Fixing and Ground	Threaded M12 stud on case bottom
Mounting position	vertical preferable for better cooling
Protection degree	IP20 (only D ≥ 85mm)
Installation	Indoor
Discharge resistors	Included
Discharge time	< 3 minutes to 75V or less
Applicable standards	IEC 60831-1/2

Vn = 480V - 60Hz
